Subject: Request for mechanical engineering internship at master level for SPRING 2012

Dear Sir or Madam,

I have my first year of master in mechanical engineering at the University of Rennes 1 in France. I am planning to get my 2nd year of master in mechatronics (mechanical + electrical + computer science). After obtaining my master, I would like to obtain an MBA in the United States. My career goal is to become head of a department of research and development for a mechanical engineering related company.

Engineering excites me since my childhood. In fact, I participated in robotics competitions such as the FIRST competition in the USA. The same year, when I was 17, I completely disassembled my Mitsubishi 3000GT and added two turbos on it. My training now is focused on all the industrial processes related to product development. I frequently use software such as CATIA V5R19 and Comsol 3.5. For 2 years I've been creating a hybrid car prototype with other students. I've learned different techniques to choose materials and how to design parts, in theory and practice. I believe I can bring enthusiasm, because I am motivated by a passion.

To complete the first year of my master, I have to do an internship of at least 8 weeks in the field of mechanical engineering. The internship, full time, may begin as early as January 8th, 2012. It can be about various stages of product development such as design and computer aided manufacturing, production or control room. A specific project must be defined in conjunction with the topics studied at university.

I am at your disposal for any request for additional information.

Accept, Sir or Madam, the assurances of my highest consideration.
